The application's user interface is presented in two windows. On the left, the image processing window enables you to define all properties of the image acquisition, such as the signal source and data filter type. The second window is the information window, where you can manually specify the chart and axis properties. Once the acquisition process has completed, the application will display the results in the information window. While the application is running, you can also adjust the chart properties. Nanosurf Easyscan can operate as a standalone or in combination with most types of optical and SEM microscopes. All you have to do is connect your microscope and provide basic system information to set the application properties. The Nanosurf Easyscan auto-detection feature helps make your experience with the application more convenient. Nanosurf Easyscan has a simple to use single-button interface, which enables you to control the application without opening additional windows. Additionally, the application has a built-in help section so that you do not have to rely solely on an online manual. Nanosurf Easyscan software can simulate various image processing conditions, thereby helping you to control and evaluate your signal and data-acquisition results. This software can also generate a spectrum or lithography simulation so that you can easily predict and detect results. Examples of images that can be processed by Nanosurf Easyscan: Displayed within the image processing window are the target surface properties: - Height (measured by imaging the nanoscale surface profile). - Roughness (measured by imaging the nanoscale surface profile). - Apparent height (the distance between the zeroth-order and first-order diffraction maxima or a point on the surface). - Roughness (the standard deviation of the surface profile). - Profile data is displayed on a logarithmic scale. The same-color lines in the left graph correspond to the same-color lines in the right graph. The line on the right graph has a longer scale range. In the information window, the chart properties are displayed: - Scale (cannot be changed). - Chart type (image acquisition or lithography simulation). - Plot color (the same data is displayed in various colors). - Label (you can create your own labels). - Data source (which data acquisition software is currently being used). - Filter type (the type of filter applied to the data (binormal, central ga
